GLOBAL FUEL PRICES AND TAXATION TRENDS

Chart Report • Filter-oriented analysis

Dataset scope stated in the project materials: 27,468 records, 84 countries, 7 regions, from 6 January 2020 to 6 April 2026.

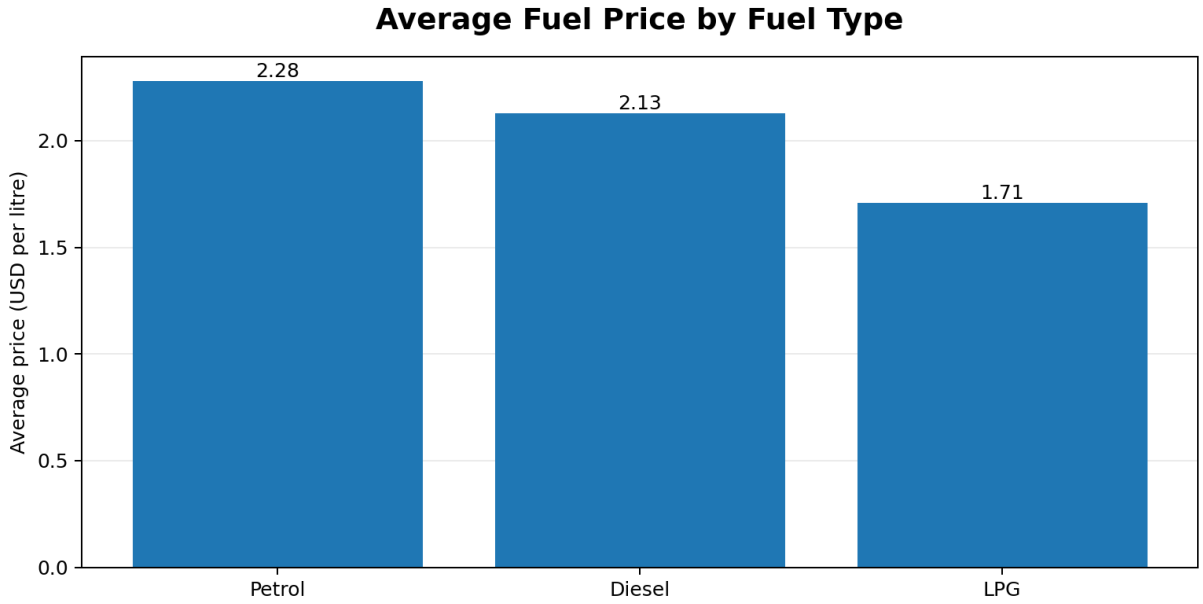

Filter dimensions reflected in the provided screenshots: Country, fuel measure/type, year, region and income level. The project report also describes Region and IncomeLevel dashboard filters; the broader project story includes subsidy categories.

Important data note: The raw CSV was not attached in this message. To avoid inventing figures, the charts below use only numerical summaries explicitly stated in the previously supplied project report. These are not recomputed from all 27,468 rows. The annual 2026 value is partial-year.

Charts included

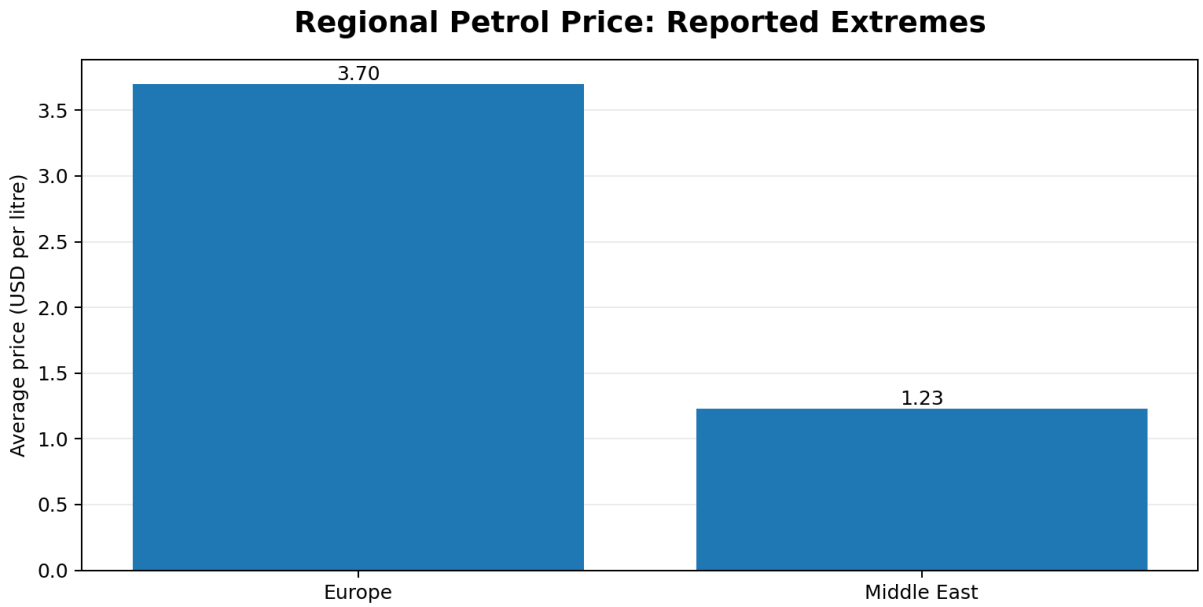

- Average fuel prices by fuel type
- Regional petrol-price comparison
- Average petrol price by income level
- Average price by subsidy category: reported endpoints
- Annual petrol-price trend
- Tax percentage and petrol price

Average fuel prices by fuel type

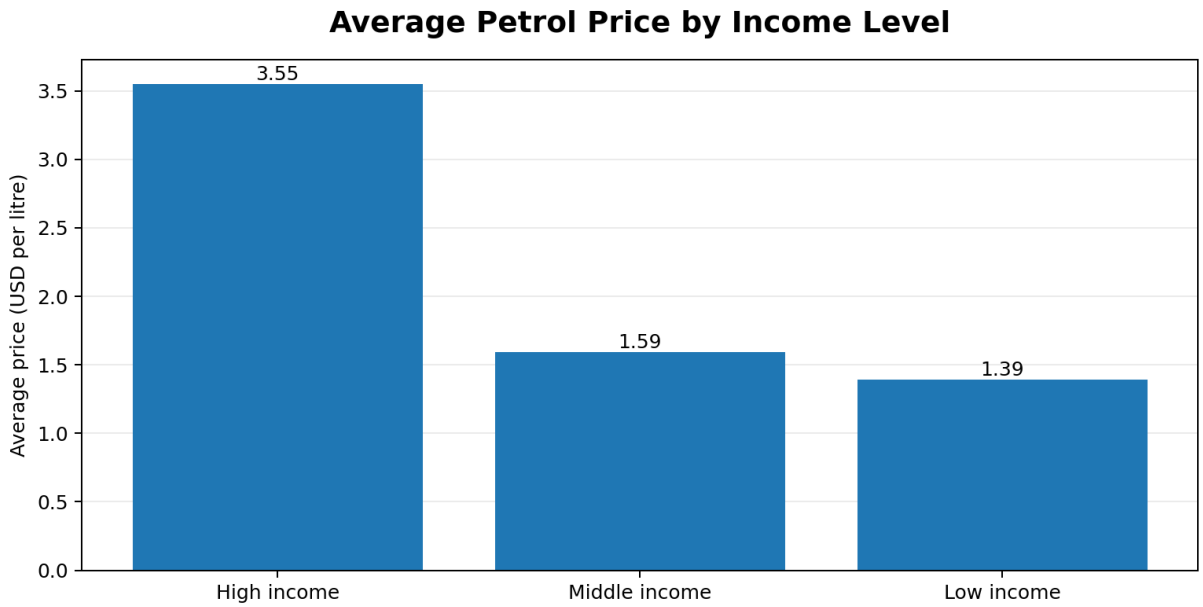

Petrol has the highest overall mean ($2.28/L) among these three fuels; LPG has the lowest ($1.71/L).

Regional petrol-price comparison

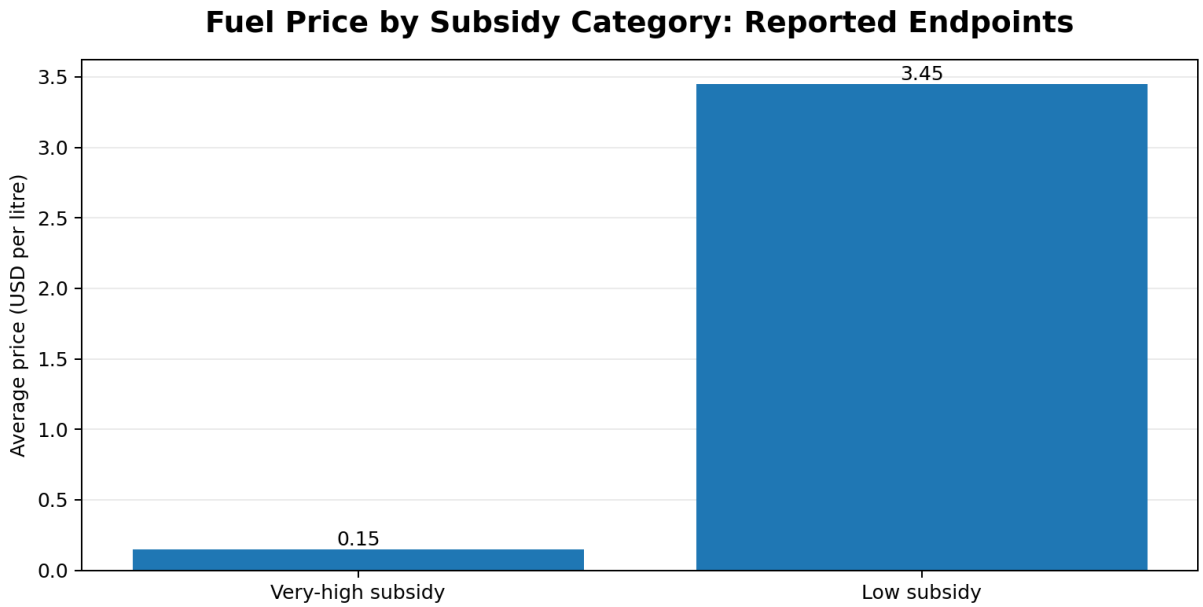

Among the reported regional extremes, Europe averages $3.70/L and the Middle East $1.23/L. This chart shows only the two regions explicitly reported.

Average petrol price by income level

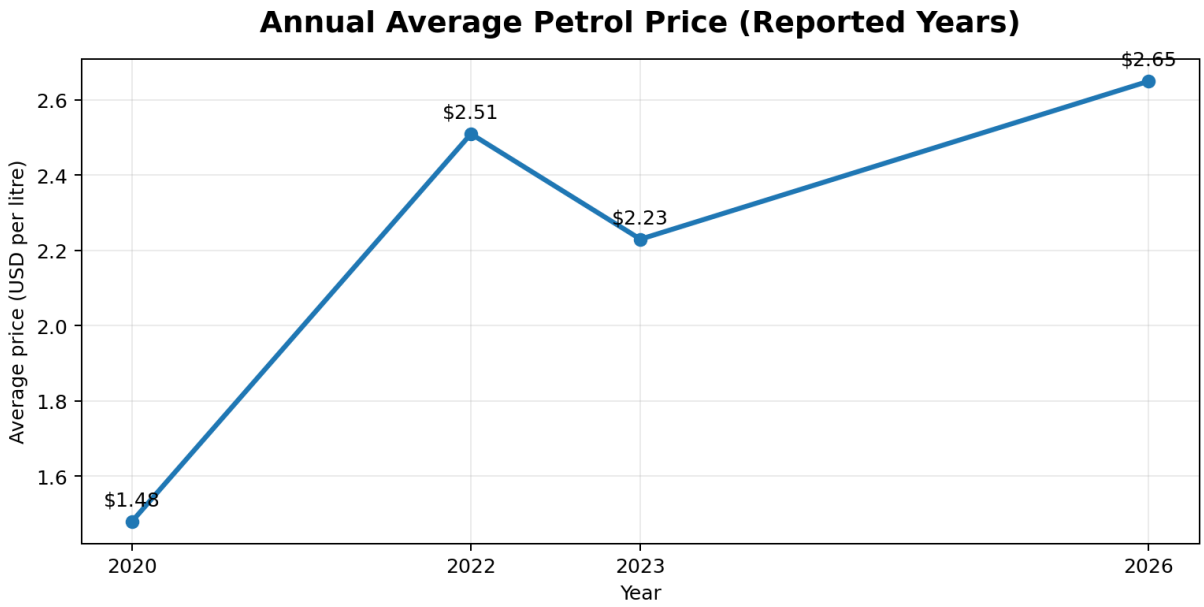

The report's group averages are $3.55/L, $1.59/L and $1.39/L respectively. These are descriptive group associations, not proof that income alone determines prices.

Average price by subsidy category: reported endpoints

The report gives $0.15/L for the very-high-subsidy group and $3.45/L for the low-subsidy group. Intermediate categories were not provided, so they are not invented here.

Annual petrol-price trend

The supplied report explicitly lists 2020 ($1.48/L), 2022 ($2.51/L), 2023 ($2.23/L), and partial-year 2026 ($2.65/L). Years without a reported figure are omitted; 2026 ends on 6 April.

Tax percentage and petrol price

r = +0.52

Positive correlation between petrol price and tax percentage

Correlation indicates association; it does not prove causation.

The report states a positive correlation of r = 0.52. Raw point-level data was not available here, so no scatterplot or regression line has been fabricated.

How to apply the filters in Tableau

Filter	Purpose
Country	Select one or more countries for country-level comparison.
Measure / Fuel type	Switch between petrol, diesel, LPG and any other available measure.
Year	Compare observations by year; interpret 2026 as partial-year data.
Region	Limit the view to a selected world region.
IncomeLevel	Compare prices across income-level groups.
Subsidy category	Use if this field is available in the connected dataset and worksheet.

To produce exact charts for every row and filter combination: upload the original CSV file (the one named similar to global_fuel_prices_Dataset.csv). Then the charts can be recalculated directly from the raw data rather than the report summaries.

Source for the displayed summary values: the project report and slide deck already supplied in this conversation. Figures are descriptive summaries, not current fuel-price quotes.
